WRPASS is significantly more reliable than PASSWP when *encryption* keys of all possible lengths are considered. Second, once the inherent limitations of PASSWP are understood, there will be a propensity on the part of the users to use *encryption* keys in excess of ten characters. Third, in the WRPASS documentation, there is an explicit statement that should WRPASS not successfully recover a *encryption key,* the technical support staff at AccessData will recover the *encryption key* at no additional charge. Thus, the purchase of WRPASS is analogous to the purchase of an *encryption key* recovery service contract where the software functions as an interface that optimizes service by minimising external service requests.
